*Alaska Economic Trends* is a monthly publication dealing with a variety of economic-related issues in the state.

*Alaska Economic Trends* is funded by the Employment Security Division and published by the Department of Labor and Workforce Development, P.O. Box 21149, Juneau, Alaska 99802-1149.

Printed and distributed by Assets, Inc., a vocational training and employment program, at a cost of \$.82 per copy.

For more information, email the authors.

For mailing list changes or back copies, contact the subscriptions desk.

Material in this publication is public information and, with appropriate credit, may be reproduced without permission.

*Trends* is available on the Internet. See URL above.

Labor Economists

## It's an Alaska obsession

Ever since the first gold strike, Alaska's higher cost of living has been a major topic of conversation. A body of lore and myth surrounds the idea of how much things cost in Alaska versus the rest of the nation. Although these cost-of-living differences have narrowed over the past 20 years, they are still of intense interest. In fact, cost-of-living economic series rank among the most-requested information. Answers to questions about the cost of living in Alaska are provided in this article.

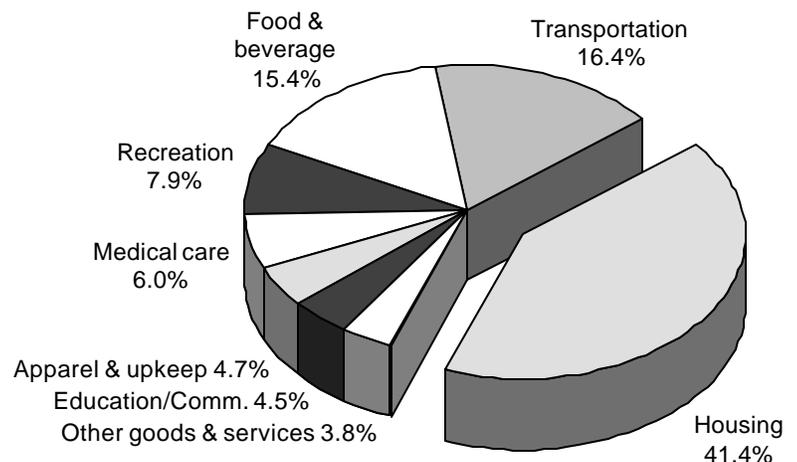

## There are two cost-of-living measures

Cost-of-living has two very different types of measures. The Consumer Price Index (CPI) observes the change in the cost of living over time in a specific place, popularly referred to as the inflation rate. Labor unions, employers, workers, and others pay close attention to this measure of inflation. Bargaining agreements and other wage rate negotiations often incorporate an adjustment for inflation. The rate also plays a role in long-term rental contracts and child support payments, and each year the Permanent Fund Corporation uses it to "inflation proof" the fund. If change over time is the key element in cost of living discussions, then the CPI must be used.

A second cost-of-living measure develops from the investigation of basic consumer costs in various geographic locations. In these indexes, the cost of living is compared among different communities in Alaska and other places in the

country. These studies assume a certain consumption pattern and investigate how much more or less it might cost to uphold a specific standard of living in the different areas. These comparisons play a big role in relocation activity. A variety of such measures is available. They include the Runzheimer International Index, the U.S. Department of Agriculture's *Cost of Food at Home* study, the American Chamber of Commerce Researchers Association (ACCRA) index, information from the Alaska Housing Finance Corporation, and any of the web based indexes included at the end of this article.

## Indexes require caution

Each cost-of-living measure has its shortcomings. Because no two consumers spend their money alike, no index accurately captures all of the differences. For example, the average household in Barrow may spend income quite differently than the average household in Fairbanks. Because those differences can stack up dramatically against a household in San Francisco, such comparisons are not easy to make. People's spending habits are also continuously in flux. Technology keeps changing, tastes change, and people react differently to changes in consumer prices. In spite of these variables, most of the cost-of-living indexes measure prices from a sample of goods and services that they believe best mimic the "average consumer" or a specific group of consumers. Items such as housing, food, transportation, medical care, and entertainment are included in these surveys. This list of items is often referred to as the "market basket." Some market baskets are quite complex and others are very simple. Understanding the contents of the market basket and which consumer buying habits it attempts to imitate, are important to deciding which cost-of-living index to use.

## How much are prices rising? The Anchorage Consumer Price Index

The Anchorage Consumer Price Index (CPI) is probably the most important cost-of-living index in Alaska. Anchorage is the only community in the state where the U.S. Department of Labor's Bureau of Labor Statistics (BLS) produces such an index, and it is often treated as the de facto statewide inflation measure. Anchorage is one of 87 urban communities in the country where the bureau tracks changes in consumer prices. In most cases, price changes in Anchorage probably do not differ radically from other communities in the state. However, some people prefer to use the national or Seattle CPI.

The U.S. Department of Labor goes to great length and expense to produce the CPI. Intermittently, BLS conducts elaborate surveys of Anchorage consumer spending habits to examine the market basket of goods and determine the location-specific weights of the goods. The results are published in the BLS consumer expenditure survey. (See Exhibit 1.) To measure the price changes the bureau collects prices for goods and services in the market basket on a regular basis. The Anchorage CPI is produced on a

semi-annual basis, for the periods January to June and July to December. After the July-December index is released in February of the following year, the annual average index, which is the most-observed measure, can be calculated. (See Exhibit 2.)

Two different indexes are produced—the Consumer Price Index for All Urban Consumers (CPI-U) and the Consumer Price Index for Wage and Clerical Workers (CPI-W). The CPI-U is the most prominent measure and is used more frequently than any other inflation measure. The CPI-W index is derived from a significantly smaller consumer group. The rest of the references in this article to the CPI will refer to the CPI-U.

Although a national CPI is produced along with indexes for many communities around the country, these indexes cannot be used to compare costs between different locations. The CPI measures only changes in prices in a particular location. For example, the annual average index for Anchorage in 2000 was 150.9 compared to the national index of 172.2. This does not mean that the nation’s average cost of living was higher than in Anchorage. The evidence one can glean from other indexes described in this article is quite the contrary. What the index numbers do mean is that prices or inflation since the early 1980s have increased faster in the rest of the nation than they have in Anchorage. The reason for this is explained below. The base period for these indexes, (where they both equal 100) is 1982-84.

### Low inflation has been the norm in recent years

Inflation in Anchorage has not crested the three-percent mark on an annual average basis for the past seven years. (See Exhibit 3.) During the last four years it has not even reached two percent for any one year. Moderate increases in housing costs and relatively small increases in most of the other categories have kept larger increases at bay.

### Housing gives the index its local flavor

#### Calculating Consumer Price Index (CPI) Changes

Index movements from one time period to another are usually expressed as percent changes rather than changes in index points, because index point changes are affected by the level of the index with respect to its base period, while percent changes are not. The example below illustrates the computation of index points and percent changes.

##### Index Point Change

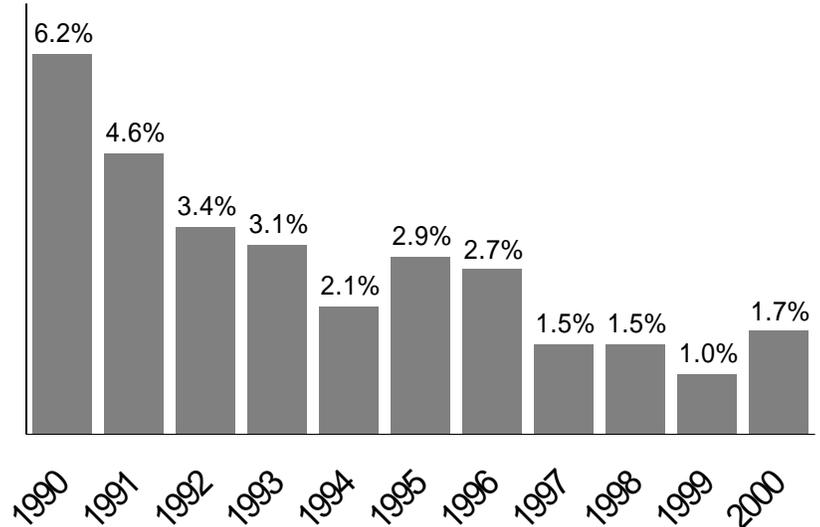

CPI-Anchorage 2000	150.9
Less CPI for previous period (Anchorage 1999)	148.4
Equals index point change	2.5

##### Percent Change

Index point difference	2.5
Divided by the previous index	148.4
Equals	0.017
Results multiplied by 100	0.017 x 100
Equals percent change-Anchorage CPI 2000	1.7

## Anchorage Consumer Price Increases 3 Below 2% since 1997

Consumer Price Index for All Urban Consumers (CPI-U)

Source: U.S. Department of Labor, Bureau of Labor Statistics

Housing lends local character to the CPI for a number of reasons. Exhibit 1 shows the different weights that are assigned to the CPI. Housing represents the single largest component, because it takes the largest share of the average consumer's spending dollar. Therefore, housing has a powerful influence on the overall index. For example, during the mid-to-late 1980s when Anchorage's real estate market crashed, the overall Anchorage CPI recorded nearly zero inflation because the cost of housing took such a beating. During the same period the national housing market was robust, so the national index moved considerably ahead of Anchorage. Through the mid-1990s the Anchorage and national housing markets were similar and the overall annual rates of change were comparable. In recent years the national housing market heated up considerably compared to Anchorage's more modest gains, causing

inflation in the rest of the nation to outstrip Anchorage.

The other reason housing flavors the overall Anchorage CPI is that costs of most of the other goods and services that fill the CPI market basket are largely dictated by national or international trends. For example, price changes for gasoline, food, clothing, insurance, transportation, health care, recreation, and most other goods and services are responses to national and global market conditions.

Because housing carries such strong weight, be aware that the Bureau's housing cost measures have shortcomings. The CPI uses a housing cost configuration called rental equivalency. It equates the costs for home ownership to the current rental value of the same home on the open market. A potential problem with this methodology develops

Source: U.S. Department of Labor, Bureau of Labor Statistics

when the housing market is in flux. When rental or housing prices are changing fast, the inflation rate for the housing portion of the CPI may be exaggerated. This occurs because many homeowners have long-term fixed interest rate mortgages, which reflect past housing market conditions. So in times when the local housing market became overheated and prices rose rapidly, property owners with fixed rate mortgages were not affected. In such an environment, the rate of inflation would be overstated. The opposite scenario develops in a down market.

To evaluate the influence of the housing market on the CPI, the bureau produces an index that excludes housing. It is referred to as the CPI-U All Items Less Shelter component. (See Exhibit 4.) Using the All Items Less Shelter index for comparison between Anchorage and the nation shows that the difference of the indexes over the years is much smaller.

## Medical care costs rose the fastest

Although medical care costs are a fairly small component of the CPI and are unable to push the overall index around very much, their meteoric rise in Anchorage over time has caught people's attention. (See Exhibit 5.) No other component of the CPI has come close to matching the increases in health care prices. The national experience has been similar to Anchorage's. During the past decade medical care costs in Anchorage have grown by 68.8%, much faster than the overall index, which increased by 27.2%. In 1998 and 1999 health care cost increases fell below three percent, but in 2000 this index regained its former momentum. As the state and national population continues to age and the need for health care expands, ever-rising costs will continue to challenge affordability for these services.

## Food costs around the state

Four times a year, the University of Alaska Fairbanks Cooperative Extension Service posts results from its *Cost of Food at Home* survey for 20 communities around the state. (See Exhibit 6.) This food basket assembles items that contain minimum levels of nutrition for an individual or family at the lowest possible cost. In addition, the survey includes information on utility and fuel costs. The geographic coverage of the study is its biggest strength. No other survey in the state covers as many communities. Another strength is that it has been produced consistently for many years. The survey's biggest weakness is that it is largely limited to food, which is only a small component in the cost-of-living picture.

Other problems surface with the food cost study because many items that can be purchased in urban Alaska are not available in rural communities. The study also assumes that the market basket consists of identical items in all of the communities even though the buying habits of residents in the different places may vary

dramatically. Recently the study included cost calculations of the widespread rural habit of ordering grocery items via mail from urban merchants; but other items entering the rural areas by barter or imported as baggage or private cargo are not included. Moreover, the local grocery list of base nutritional items also ignores the substitution of subsistence-harvested meats, fowl, fish, berries, and other foods for store-bought items.

According to the December 2000 *Cost of Food at Home* study, a family of four in Alaska enjoyed the lowest food costs in urban areas such as Anchorage, Fairbanks, and Juneau. The highest costs tended to be in remotely situated communities which are serviced by air and where the marketplace is small. Dillingham and Bethel belong in this category. Other high cost areas also exist in small places that lie on a major transportation system such as highways or the Alaska Marine Highway System. Grocery prices in these places often fall between the urban and remote-rural price ranges. Examples of such places are Petersburg, Tok, Delta, and Homer. But location is not everything. The size of the market, the level of competition, and the relative proximity to a larger urban area are other major determinants of food costs.

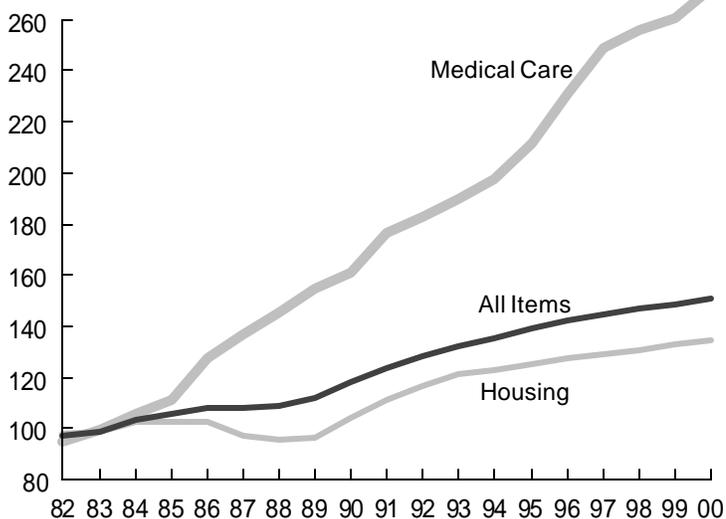

## Rents are high in Juneau and Kodiak

Because housing gobbles up such a large slice of household income it often is a good proxy for an area's cost of living. The Alaska Housing Finance Corporation contracts with the Alaska Department of Labor and Workforce Development to collect rental housing data for 10 communities around the state. Exhibits 7 and 8 display monthly rental costs for two-bedroom apartments and three-bedroom single-family homes.

Like food and other items, the cost of housing varies dramatically among areas. The supply of housing, vacancy rates, quality of housing, condition of the local economy, building costs, and local demographics are factors that help

## 5 Medical Costs Increase Most

Anchorage CPI-U for selected components 1982-2000

Source: U.S. Department of Labor, Bureau of Labor Statistics

explain some of the differences. Apartment and single-family home rental cost data show strong similarities but also point out differences. Rental costs of apartments and houses are most expensive in Juneau and Kodiak. But rental costs for single family houses in Anchorage are the third highest in the state whereas rent for apartments ranked sixth place.

The Alaska Housing Finance Corporation also establishes a housing affordability index for a number of areas in the state. (See Exhibit 9.) This index takes into account not only the cost of housing but also the degree to which buyers can afford it. The affordability question is measured by the average annual wage of the area and how

many of these wage earners are needed to afford the “average” home. Combining these two factors yields some interesting results. For example, the Mat-Su Borough has some of the lowest housing costs, but because the average wage in the area is relatively low, 1.7 Mat-Su wage earners are required to afford the “average” home. The wrinkle in this figure, however, is that many Mat-Su residents work in Anchorage or elsewhere where the average wage is significantly higher, making the housing market in Mat-Su very affordable for them. In Ketchikan and Juneau, where wages are above average, housing is less affordable because of the high purchase price of homes in both places. And it is not surprising that affordability of housing in Bethel is in an altogether

### Is housing really more affordable in Anchorage than in most U.S. cities?

A comparison of the affordability of home ownership in Anchorage to other metropolitan places in the nation reveals that owning a home in Anchorage is not just a dream for most residents. In fact, the index shows that an Anchorage family with a median annual income of \$59,300 could afford to purchase 79.4% of all homes sold. (See Exhibit 10.) This puts Anchorage in the upper quartile of affordable home ownership for the areas surveyed. It ranked as the twentieth most affordable place among 180 metropolitan places in the nation. During the fourth quarter of 2000, it became the most affordable housing market in western United States. The average sales price of \$135,000 came in 10 percent below the average for 180 metropolitan cities. Anchorage's average family income was 15 percent above the metro average, and this helped Anchorage's affordability index land in such a favorable spot.

### ACCRA identifies Alaska's cities as high-cost locations

The American Chamber of Commerce Researchers Association (ACCRA) publishes quarterly results of a detailed cost-of-living survey conducted in more than 300 U.S. cities. The study examines costs for 59 specific consumer items and classifies survey results in cost categories such as groceries, housing, utilities, transportation, health care and miscellaneous goods and services. Average composite costs for all U.S. cities and the individual cost categories, all indexed at 100, are developed from this sample. ACCRA designed a consumption pattern that is styled after a professional and executive household in the top income quartile. ACCRA weighs consumer expenditures and infers that this household's market basket spends 16% on food items, 28% for housing, 8% for utilities, 10% for transportation, 5% for healthcare, and 33% on miscellaneous goods and services.

As expected, the fourth quarter 2000 ACCRA survey confirmed that the cost of living in Anchorage, Fairbanks, and Kodiak was well above the national average. Anchorage's cost index weighed in at 22.9% above the national average, Fairbanks 20.1% higher, and Kodiak's was 29.1% above the national average. (See Exhibit 11.) In 1999, Kodiak's cost differential was 36.2% higher. In 2000, Kodiak's consumer cost gap narrowed in the housing, utilities, and goods and services categories. The change was most dramatic in goods and services, where the drop was 20.6%. Undoubtedly, the new Wal-Mart store helped to lower costs in Kodiak for a variety of typical consumer items.

Housing was not the only component to drive up overall local consumer costs in Alaska cities. Consumer expenditures in all categories except one were above the U.S. city standard. Utility costs in Anchorage, a component that carries just moderate weight in a consumer's expenditure pattern, were contained by low natural gas costs. The biggest cost differentials in Alaska's marketplace were in grocery prices, health care, and miscellaneous goods and services. In each of these categories, the three Alaska cities ranked among the five costliest places among the 303 locations tested in the current survey. (See Exhibit 12.) Doctor visits, for example, are nearly as expensive in Fairbanks as those in New York's Manhattan Borough. (See Exhibit 13.)

According to ACCRA, high costs of living distinguish Alaska cities from most other places in the nation. Only eleven other U.S. cities surveyed by ACCRA had costs above the 20 percent mark. (See Exhibit 11.) ACCRA identified New York-Manhattan as the most expensive place in the nation, where costs of living exceed the national average by a magnificent 135%, followed by San Francisco, where typical consumer costs were nearly double the national standard. The study identified other "spendy" places as Nassau County, N.Y.; Boston and Framingham-Natick, both in Massachusetts; New Haven, Connecticut; Philadelphia, Pennsylvania; Glenwood Springs, Colorado; Los Alamos, New Mexico; Los Angeles-

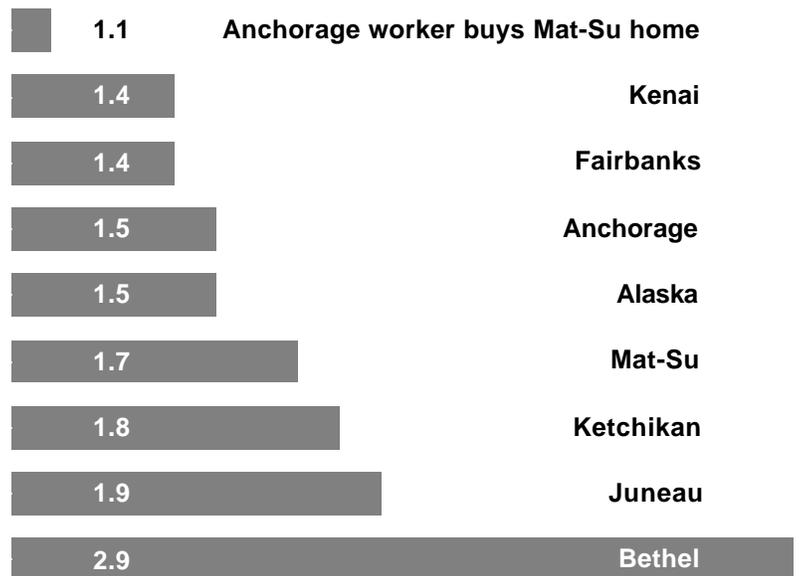

Long Beach and San Diego, both in California. The cost differentials in these places varied between 21 to 44 percent over the national index. The ACCRA numbers, however, do not address taxation.

### The cost-of-living studies differ

The Runzheimer Living Cost Standards survey differs from ACCRA in many ways. While ACCRA represents consumer expenditures for an upper income professional family, the Runzheimer research group studies the consumption of families with a specific income and disregards the occupational status of the prime income earner. In 2000, the Alaska Department of Labor and Workforce Development commissioned Runzheimer International to explore the differentials in costs of living for a family of four. Unlike the ACCRA survey, the Runzheimer study recognizes the tax burden in consumer spending.

### Runzheimer survey shows smaller cost-

## Number of Wage Earners Needed to buy average house 9

## of-living differential

Runzheimer is a private sector research firm that specializes in national and international cost of living comparisons. The studies compare the cost of living among cities with reference to a U.S. city standard. Because earnings fluctuate widely among family households in any given city, Runzheimer established a base income to identify a specific consumer group to compare typical expenditures among various geographic locations. The comparison shows how much more or less income is required in different locations to support this family's standard of living. (See Exhibit 14.)

The Runzheimer study categorizes consumer costs into four major groups: taxation,

transportation, housing costs, and expenses for goods and services. Taxation data represent location-specific federal, state, and local taxes. Tax profiles of the various locations reflect the amounts reported on itemized tax deduction forms submitted to the Internal Revenue Service. Alaska's Permanent Fund Dividend distribution is not taken into consideration in the Runzheimer study.

The transportation cost model assumes a 240-day workplace commute via public transportation or in a personal car. In all, miles driven for workplace commute and personal travel accumulate to a 16,000 per year standard. The automobile type used by the surveyed consumer group in the year 2000 resembles a 1997 Ford Contour GL.

Operational expenses such as gasoline, maintenance, license, taxes, insurance, depreciation and interest are part of the transportation cost model.

Housing costs include mortgage payments stretched over 30 years, assumed after a 20 percent down payment and applied to the value of a 1,500 square foot 3-bedroom home with 1.5 bathrooms. Real estate taxes, insurance, utilities and maintenance are also included in housing costs.

The goods, services and other category describes typical household costs such as groceries, restaurant

dining, furnishings, personal care items, health care, recreation, and miscellaneous services and items that are typically purchased by a family with the standard \$32,000 income. Sales taxes are included in the prices of goods and services whenever applicable.

The 2000 Runzheimer study showed combined consumer expenditures in Anchorage to be nearly five percent above the national average. In Fairbanks this gap widened to nearly eight percent; and in Juneau the differential rose to 19 percent. (See Exhibit 14.) With the exception of taxation, family expenditures in all three Alaska locations in all other categories were above the

U.S. city standard. Only one differential was extreme. Housing costs in Juneau were 46 percent above the U.S. base.

The national comparison revealed that costs of living in cities in coastal states in the West and Northeast were above those of places in the Midwest or Southwest/Mountain regions. Living expenses were lower in Southeastern cities. In

general, all city locations with high population densities and/or restricted land availability had high housing costs. Housing costs carry by far the most weight in family household spending in all locations, and also vary most from place to place.

## **Alaska Cost-of-Living Information on the World-Wide Web**

In addition to the information in this article, five web sites provide quick cost-of-living comparisons. Most of these sites provide little detail, but can be a handy quick reference.

<http://www.labor.state.ak.us/research/relocate/relocmap.htm>

The Alaska Department of Labor and Workforce Development's relocation site offers cost-of-living information, general information about Alaska, information on employment opportunities, and information about traveling to Alaska.

<http://stats.bls.gov/cpihome.htm>

The U.S. Department of Labor, Bureau of Labor Statistics, Consumer Price Index site provides CPI data for Anchorage and many other areas. It also provides general, technical, and research information on the CPI, and an inflation calculator.

<http://www.homefair.com/calc/citysnap.html>

The Homefair City Reports give a side-by-side comparison of two cities' cost of living, climate, demographics, and other vital information from a database that is kept current with quarterly updates. Homefair City Reports offer one complimentary report with up to two destinations.

<http://www.datamasters.com/cgi-bin/col.pl>

DataMasters Inc., like Homefair City Reports, allows you to compare the level of income needed to maintain the purchasing power you currently have. Not surprisingly, DataMasters results can differ from Homefair Reports, suggesting that multiple sources and a thorough investigation are your best tactics when researching cost-of-living information.

<http://mazerecruiters.com/job.htm>

The Maze Recruiters & Associates web site provides a cost-of-living index that incorporates the impact of taxes. The index merges federal, state, and local taxes with American Chamber of Commerce Researchers Association (ACCRA) cost of goods and services data to provide a comprehensive cost-of-living index.

# Oil and Gas Activity Boosts Employment Growth

Job count up 4,700 over March a year ago

## Alaska Employment Scene

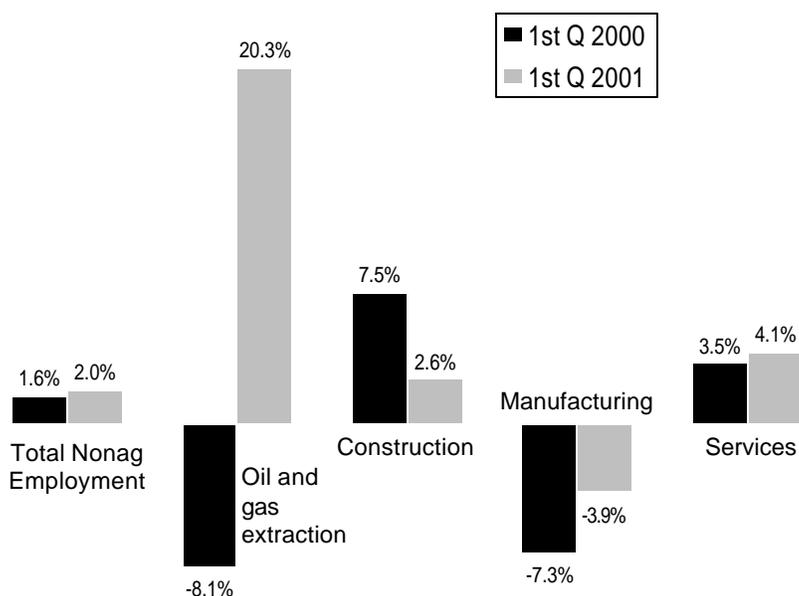

by  
Rachel Baker  
Labor Economist

**A**t the end of the first quarter of 2001, things were looking good in Alaska's labor market. In March 2001, total wage and salary employment stood at 4,700 jobs ahead of the previous year. (See Exhibit 3.) Combined statistics for the first quarter of 2001 presented an even more positive employment picture. Nearly 5,400 jobs have been added since

the first quarter of 2000, which translates into 2 percent employment growth. This outpaced over-the-year employment growth recorded in the first quarter of 2000 by more than 1,000 jobs.

The primary difference between the first quarters of 2001 and 2000 is the health of Alaska's oil and gas industry. In the first quarter of 2000, the oil and gas industry ran a 700-job deficit from the previous year. The price of oil was low and uncertainty about the BP Amoco and ARCO merger contributed to the industry retrenchment. During the second half of 2000 and the first few months of 2001, higher oil prices helped reverse the job deficit, and at the end of March 2001, over-the-year employment growth was nearly 1,600 jobs, or just over 20 percent in oil and gas extraction. (See Exhibit 1.)

### 1 Over-the-Year Employment Growth 1st Quarter 2000 vs. 2001

Source: Alaska Department of Labor and Workforce Development, Research and Analysis Section

### High oil prices, pipeline hopes energize economy

Prolonged high oil prices, the possibility of a natural gas pipeline, and increased optimism about drilling in Alaska's National Petroleum Reserve have provided the state's economy with extra energy. Some work on the natural gas pipeline feasibility study has already commenced. Many jobs related to the project will actually be added in the services category—primarily business, engineering, and environmental

services. An estimated 600 additional jobs could be added to Alaska's economy from the pipeline feasibility work this year.

## Construction and services provide momentum

In March, the state's construction industry began a seasonal increase in activity. Although the industry is a few months away from swinging into peak activity, the employment numbers are already looking good. In March, over-the-year growth stood at 400 jobs in the construction industry, and this strength is expected to continue or improve. Public construction continues to move forward at a vigorous pace and oil-related construction will continue through the summer season.

Commercial construction activity is also expected to be strong, particularly in Anchorage. Two multi-story office buildings will be under construction this year, and developers are moving forward with plans for a 23-story multi-use building in downtown Anchorage. The out-of-state developers cited Anchorage's strong, steady economy as the reason for choosing the sites. Some of the construction enthusiasm that spread through Anchorage earlier this year was calmed a bit recently when Home Depot, Sam's Club, Wal-Mart, and Lowe's announced plans to cancel or postpone construction of several retail stores.

Brisk construction activity also contributed to the relatively low statewide unemployment rate in March. Although 2000 was a good year for Alaska's construction industry, this year's season is shaping up to be even better. One indication of this is the number of unemployment weeks paid for the construction industry in March 2001, which was 13.5% below the March 2000 statewide level. Significant over-the-year declines in weeks paid to unemployed construction workers took place in Anchorage and Fairbanks.

In March, more than half of all new jobs came

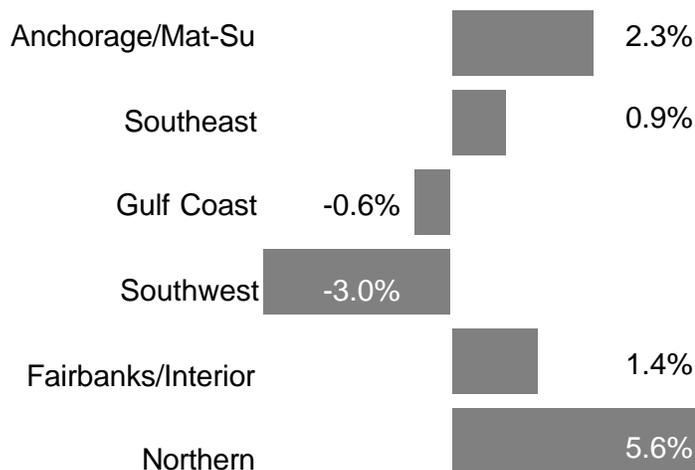

from the services industry, where employment in nearly every category is on the rise. Health care employment numbers are still climbing with the continued movement of jobs from the Indian Health Service to the Alaska Native Medical Center. Hotel employment is up by more than 7% or 400 jobs compared to March 2000. This growth will continue as new hotels in Fairbanks add staff for the summer season.

## Timber and seafood processing pull down manufacturing employment

Prolonged low timber prices continue to vex Alaska's lumber and wood products industry. Over-the-year employment was down by 13% in March. The beginning of April brought more bad news for the industry as the U.S. Forest Service halted all logging in the Tongass National Forest. The logging suspension was in response to a court order requiring the Forest Service to resolve administrative details about areas of the Tongass that were proposed for roadless designation.

*(continued on page 22)*

## Job Growth Positive in Most Regions March 2000-2001 employment growth **2**

<b>Seasonally Adjusted</b>			
United States	4.3	4.2	4.0
Alaska Statewide	5.8	5.8	6.9

Manufacturing employment was also pulled down by over-the-year losses in seafood processing. The Southwest region of the state is carrying most of this loss, where restrictions on groundfish harvest have cut back processing employment.

In fact, troubles in the seafood processing industry contributed to negative employment growth in the Southwest and Gulf Coast regions of the state. (See Exhibit 2.) All other regions in the state added jobs over the year. The Northern region recorded the largest over-the-year growth in percentage terms, at 5.6% in March. Other regional employment growth in March ranged from near 1% in Southeast to just over 2% in Anchorage.

### National economic slowdown could affect tourism

In March, Alaska's economy began to gear up for the tourism season. Early indications, however, are that this season's tourist activity will be flat or down from last year. Although the number of cruise ship visitors is expected to break another record this year, anecdotal evidence suggests that advance bookings for lodging, tours, air travel, and other services are down from last year.

The weakening national economy is the primary reason cited for flat to declining tourism activity. Although the peak season is usually reliable for Alaska's tourism industry, business owners might feel the cutback in the "shoulder seasons" around the peak months.

#### 2000 Benchmark

Comparisons between different time periods are not as meaningful as other time series produced by Research and Analysis. The official definition of unemployment currently in place excludes anyone who has not made an active attempt to find work in the four-week period up to and including the week that includes the 12th of the reference month. Due to the scarcity of employment opportunities in rural Alaska, many individuals do not meet the official definition of unemployed because they have not conducted an active jobsearch. They are considered not in the labor force.

# Employer Resources

Employers, last month this space introduced you to two ways to obtain the new online job order using the AJCN home page: <http://www.jobs.state.ak.us>. Here is yet another way. Start at the AJCN Employer Connection Site at: <http://www.jobs.state.ak.us/employer.htm>. Click on "online job order". Enter the required information and submit. This is a quick and easy way to submit a job order.

<http://www.jobs.state.ak.us/employer.htm>

Welcome to the Alaska Job Center Network  
**Employer Connection**
